

Individual Reflection Week 7 - Linus

What do I want to learn or understand better?

So this is the final sprint where we probably will improve on our product, since we have almost for sure decided to focus on the administrative tasks of the course after the presentation next week. This includes everything that has to do with the github repo, final report and writing proper documentation etc. So that's what I want to improve on, being able to document everything that we have done in an easy to understand format. Haven't really worked with a proper github repo, just some small unofficial things for myself. So I hope that working together to sign off this assignment will give me some good insights into what a future employer can expect.

How can I help someone else, or the entire team, to learn something new?

Since I have been the one writing most of the code, this week when we set tasks to do proper code review I had to give a good overview of the code and how it works and what everything does. Something we probably should have been doing every sprint to the extent we did it this sprint. Everyone has seen the code and should know how it works and is setup, but as a practice I think it would have been good to make it easier for everyone to jump into coding something without having to spend a long time on setup beforehand.

What is my contribution towards the team's use of Scrum?

This sprint I was just a developer, no special scrum role. But as a team it feels like the roles feel so weird and we kind of do everything together anyway. The different roles do have some special responsibilities but the roles don't get the whole say over something. We do understand that in the real world it won't work like this, but for us it feels weird if just one or two people decide the direction of the project without everyone backing them up. I think the fact that we do make the decisions more as a group instead of how it "should" be is why we haven't had any problems within the team at all. We have almost always been on the same page with what to do and in what order. So that has been really nice and helpful.

What is my contribution towards the team's deliveries?

During the sprint review and team reflection writing meeting I participated as usual, giving my thoughts on the subject we were discussing. We have a good system going at this point in the course, where we are kind of just going on autopilot in the meeting. Everyone knows what we need to do and what to discuss.

As for the product value this week I laid the groundwork in figuring out how to change the design of the websites, figured out how to do it and showed the group, and then Christian who had a more concrete idea of how it should look took over and implemented his design. Which we as a team agreed was a good design.

Was a good sprint, we all knew what to do and did it in time. No conflicts or major issues, just working as we always have.
